IN THE ABSTRACT:

Please amend the Abstract as follows:

--A method and system of downloading a set of programs, navigational, branding
and other data to a consumer's set-top box coupled to a cable TV headend controller.
The set-top box is also coupled to the PSTN via the headend controller. A user ~~uses an
input device to~~ navigates a series of menus displayed on a display device coupled to the
set-top box and makes selections of a desired telephone service and enters any pertinent
data. When the user ~~uses a telephone coupled to the set-top box to~~ makes a telephone
call, the set-top box translates any dialed digits ~~he or she dialed~~ to a POTS number and
completes the call. Other services, such as ANI-based services, ~~typically provisioned in a
switching system~~ can also be provided in the set-top box in a similar way. Further, these
service selections made by the user are written to a portable storage medium that is
removably coupled to the set-top box, thereby enabling the user to transport the data to
another set-top box ~~configured to read the data from the portable storage medium. This
allows for a portability of the service selections made by the user.~~ --
